Bone fracture healing

Primary bone healing

- Every day process
- Requires absolute stability

- Plate fixation
- intramedullary nailing

Secondary bone healing

- Occurs with relative stability
- Involves callus formation - new bone

- External fixation

Secondary bone healing

- Bone ends are not in direct contact
- Relative motion between bone ends - Interfragmentary movement (IFM)
- Bone healing is influenced (theories) by Interfragmentary strain (IFS)

- Found 10 different mechanoregulation measures in literature

Generally, 2–10 % engineering strain is desired
